

# Scientific results of the United States Arctic Expedition, steamer Polaris, C.F. Hall commanding; vol. 1. physical observations

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1876 Excerpt: ...during winter: Diurnal fluctuation of the temperature of the air and temperature of the dew-point during winter, 1871-72. While, during the last season, the diurnal range of the temperature of the dew-point was greater than that of the air, we now see the contrary to take place. The temperature of the dew-point, according to the computed curve, reaches its maximum at 6h a. m. and its minimum at 4h p. m. Between the absolute maximum and minimum the curve is seen to oscillate in an irregular manner, thus exhibiting a number of relative maxima and minima which sometimes correspond to similar maxima and minima of the thermal curve. The difference between the temperature of the air and the temperature of the dew-point is greatest at midnight and least at 6h a. m. The computed and observed ranges of the temperature of the dew point are 0.59 and 1.35, while those of the air are 0.78 and 0.83, respectively. In order to discuss the diurnal fluctuation of the temperature during each of the different months, each month was treated analytically. The following analytical elements and expressions were used in this computation: January. The following table contains the values computed by means of the preceding analytical expressions; also the observed values and the differences between the observed and computed means: DEW-POINT. In January the differences between the computed temperature of the air and the computed temperature of the dew-point are as follows: The greatest difference occurs at 4h p. m., while the closest approximation of the two curves toward each other takes place at midnight. The computed curve representing the temperature of the

dew-point passes through the maximum of--32.)9 at 8b p. m., the minimum of--33.59 being reached at 10h a. m., thus...
